Security Essentials - Free with activation.The broad objective of the proposed research is to identify the molecular processes that regulate mucosal function in the intestinal epithelium. Signals initiated in the intestinal lumen serve as a receptor for the prompt initiation of digestion and the subsequent uptake of nutrients. It is well established that the quantity and quality of digestive enzymes are controlled by the small intestine. However, the mechanisms regulating the differential expression of these enzymes in the developing intestine are not fully understood. There is, however, evidence that distinct peptides may serve as ligands for receptors on the cell surface that can regulate the physiological functions of the intestine. Several families of endogenous opioid peptides have been identified that are expressed in the intestine. The proposed studies will examine the role of these peptides on the differentiation of the intestine and the activities of intestinal epithelial cells. Two of the opioid peptides that will be examined are DHEA-S and dynorphin A. Preliminary data suggest that 82138339de
